Abstract of th Inventi n

An improved check sorting system capable of ordering cancelled checks for a plurality of accounts in a predetermined manner other than by account number is provided. Checks are ordered according to a priority value associated with the account number, and optionally check number, identified by each check. A database is utilized to store information indexed by institution and/or account number and optionally check number. The information includes a priority value. The check sorting system scans each check and reads the MICR code from each check. The institution and/or account number, and possibly check number, from each check are used as pointers to obtain the priority value for that check. The check is then sorted based on the priority value obtained from the database.
